

Catalog Exploration With Starburst

Lesson objectives

Catalog Exploration With Starburst

1. Explain the hierarchy of Catalogs, Schemas, and Objects in Starburst Enterprise.
1. Use the query editor in the Starburst Enterprise web UI to explore available catalogs, schemas, and objects.

Catalog Hierarchy

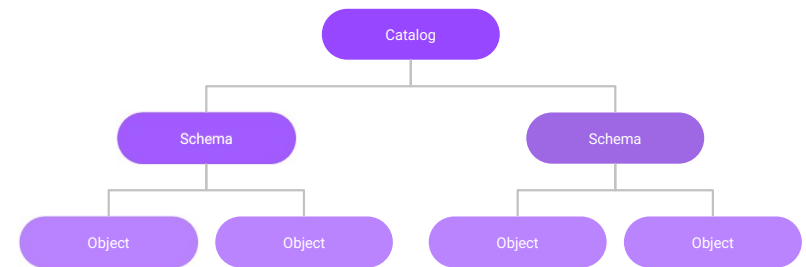

Catalogs, Schemas, & Objects

A **catalog** is the configuration that enables access to a specific data source. Every cluster can have numerous catalogs configured, and therefore allow access to many data sources.

Every catalog includes one or more **schemas**. They group together objects. Schemas are often equivalent to a specific database or schema in the underlying data source.

Every schema includes one or more **objects**. Typically these objects are **tables**, but they can also be **views** or **materialized views**.

Three-part name for a table's unique identifier: **catalog.schema.table**

Multiple Ways to Reference Tables & Views

Starburst Enterprise web UI (15
mins)

Hands-On Exercise

Explore available data in the lab
environment (15 minutes)

Lesson summary

Data Discovery With Starburst

1. Starburst can connect to a rich variety of data sources. Catalogs are the configurations that allow access to the data sources.
2. Catalogs can contain multiple schemas. Schemas can contain multiple objects.
3. Objects include tables, views, and materialized views.
4. There are multiple ways to explore catalogs in the Starburst Enterprise web UI, including using the cluster explorer and via SQL.
